

Ejercicio 8

Probar las siguientes propiedades:

I. **Debilitamiento.** Si $\Gamma \vdash \sigma$ es válido entonces $\Gamma, \tau \vdash \sigma$ es válido.

Tip: utilizar inducción sobre el tamaño de la derivación.

II. **Regla de corte.** Si $\Gamma, \tau \vdash \sigma$ es válido y $\Gamma \vdash \tau$ es válido, entonces $\Gamma \vdash \sigma$ es válido.

Vamos a probar que es válido para todas las reglas de derivación.

La H.I. es que $\Gamma \vdash \sigma \vee \sigma$ y queremos ver si $\Gamma, \tau \vdash \sigma$.

Caso ax:

$\frac{\Gamma \vdash \sigma}{\Gamma \vdash \sigma} \text{ ax} \iff \sigma \in \Gamma$. Por lo que si tenemos $\Gamma, \tau \vdash \sigma$ sigue siendo ax $\forall t$ variable porque $\sigma \in \Gamma, \tau$.

Caso \wedge_i :

Por H.I. $\Gamma \vdash \mu \wedge \sigma$, $\forall \sigma \Gamma, \tau \vdash \mu \wedge \sigma$.

$$d_1 \left\{ \frac{\Gamma \vdash \mu}{\Gamma \vdash \mu} \quad \frac{\Gamma \vdash \sigma}{\Gamma \vdash \sigma} \right\} d_2 \quad \text{Por H.I.}_1 \quad \text{Por H.I.}_2$$

$$\frac{\Gamma, \tau \vdash \mu}{\Gamma, \tau \vdash \mu \wedge \sigma} \wedge_i$$

Por H.I. si $\Gamma \vdash \mu \rightarrow \Gamma, \tau \vdash \mu$
 Por H.I. si $\Gamma \vdash \sigma \rightarrow \Gamma, \tau \vdash \sigma$ } Son el caso que queremos.

Caso $\vee \neg$:

Por H.I. $\Gamma \vdash \mu \vee \sigma$

$$\frac{\Gamma \vdash \mu \vee \sigma}{\Gamma \vdash \mu} \vee \neg \quad \text{Por H.I. en el}$$

$$\frac{\Gamma, \tau \vdash \mu \vee \sigma}{\Gamma, \tau \vdash \mu} \vee \neg$$

Por H.I. si $\Gamma \vdash \mu \vee \sigma \rightarrow \Gamma, \tau \vdash \mu \vee \sigma$

Caso \rightarrow_i :

Por H.I. $\Gamma, \sigma \vdash \mu$

$$\frac{\Gamma, \sigma \vdash \mu}{\Gamma \vdash \sigma \rightarrow \mu} \rightarrow_i \quad \text{Por H.I. en el}$$

$$\frac{\Gamma, \tau, \sigma \vdash \mu}{\Gamma, \tau \vdash \sigma \rightarrow \mu} \rightarrow_i$$

Por H.I. si $\Gamma, \sigma \vdash \mu \rightarrow \Gamma, \sigma, \tau \vdash \mu$.

Caso \rightarrow_e :

Por H.I. $\Gamma \vdash \tau \rightarrow \sigma$ y $\Gamma \vdash \tau$

$$d_1 \left\{ \frac{\Gamma \vdash \tau \rightarrow \sigma}{\Gamma \vdash \tau \rightarrow \sigma} \quad \frac{\Gamma \vdash \tau}{\Gamma \vdash \tau} \right\} d_2 \quad \text{Por H.I. en } d_1 \quad \text{Por H.I. en } d_2$$

$$\frac{\Gamma, \tau \vdash \tau \rightarrow \sigma}{\Gamma, \tau \vdash \sigma} \rightarrow_e$$

$$\exists \alpha \exists \alpha_i \exists i \quad \Gamma \vdash P \rightarrow \alpha \rightarrow \Gamma, t \vdash P \rightarrow \alpha$$

$$\exists \alpha \exists \alpha_i \exists i \quad \Gamma \vdash P \rightarrow \Gamma, t \vdash P$$

• case V_{i1}

$$\exists \alpha \exists \alpha_i \exists i \quad \Gamma \vdash P$$

$$\frac{\Gamma \vdash P}{\Gamma \vdash P \vee \alpha} \quad \text{d}$$

$$\frac{\text{val} \times \text{Hi} \text{end}}{\Gamma, t \vdash P} \quad \text{d}$$

$$\exists \alpha \exists \alpha_i \exists i \quad \Gamma \vdash P \rightarrow \Gamma, t \vdash P$$

case V_e

• $\exists \alpha \exists \alpha_i \exists i \quad \Gamma \vdash P \vee \alpha, \Gamma, P \vdash E \text{ y } \Gamma, \alpha \vdash E$

$$\text{d}_1 \left\{ \frac{\Gamma \vdash P \vee \alpha}{\Gamma \vdash E} \quad \frac{\Gamma, P \vdash E}{\Gamma, \alpha \vdash E} \right\} \text{d}_2 \left\{ \frac{\Gamma, \alpha \vdash E}{\Gamma, t \vdash E} \right\} \text{d}_3$$

$$\frac{\text{val} \times \text{Hi} \text{end}_1}{\Gamma, t \vdash P \vee \alpha} \quad \frac{\text{val} \times \text{Hi} \text{end}_2}{\Gamma, t, P \vdash E} \quad \frac{\text{val} \times \text{Hi} \text{end}_3}{\Gamma, t, \alpha \vdash E} \quad \text{ve}$$

$$\exists \alpha \exists \alpha_i \exists i \quad \Gamma \vdash P \vee \alpha \rightarrow \Gamma, t \vdash P \vee \alpha$$

$$\exists \alpha \exists \alpha_i \exists i \quad \Gamma, P \vdash E \rightarrow \Gamma, P \vdash E$$

$$\exists \alpha \exists \alpha_i \exists i \quad \Gamma, \alpha \vdash E \rightarrow \Gamma, \alpha \vdash E$$
